

SOC INCIDENT REPORT — Wazuh Alert Triage & IOC Validation

1. Incident Overview

A simulated security event was generated in Wazuh by logging a suspicious PowerShell command (`powershell.exe -enc suspicious_execution_123`). The system detected the activity using a custom rule and generated an alert for analysis and triage.

2. Alert Details

Field	Value
Alert ID	100100
Description	Suspicious PowerShell Execution Detected (Lab Simulation)
Source IP	127.0.0.1
Priority	High
Status	Open

3. Event Analysis

The alert was triggered by a custom Wazuh rule matching the presence of “powershell.exe” in a local log file (`/var/log/soc-test.log`). This indicates execution of a potentially malicious PowerShell command, commonly used in post-exploitation and attacker automation scenarios.

4. IOC Validation

VirusTotal Check

The IP address **127.0.0.1** was searched on VirusTotal. No malicious detections or threat intelligence records were found. The IP is recognized as a loopback address used for local system communication.

AlienVault OTX Check

The same IP was searched in AlienVault OTX. No pulses, indicators of compromise, or threat associations were identified.

5. Findings Summary

- The source IP is a local loopback address and not externally routable.

- No threat intelligence indicators were found in VirusTotal or OTX.
 - The activity is confirmed as a simulated lab event and not a real external attack.
-

6. Conclusion

The alert represents a **benign simulated PowerShell execution** within a controlled lab environment. No evidence of malicious external activity or compromise was found. The event is classified as **low real-world risk but high educational value for SOC training purposes**.
